

The GASBoy™ fuel management system produces an export file that can be converted and imported into Telestream. This provides for a fast and easy way to pay transactions that are assigned a Voyager card. To perform the conversion export your fuel data from your GASBoy fuel management system in the 'LONG Version' format. The file will be exported as a \*.CSV file. Select the file in the GAS Boy conversion utility and press the "Convert Gasboy data to Telestream" button. The conversion utility will create a \*.txt file that is in the correct format for importing into Telestream.

For more information on importing data into Telestream see the Import Specifications documentation for the Telestream™ application. For additional clarification contact Voyager Support.
